Ferrari V4 Superbike

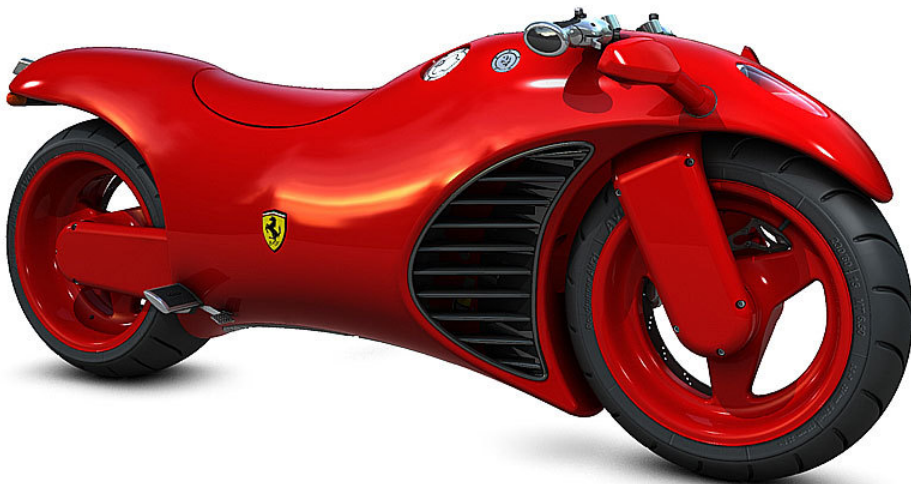

The concept motorbike is the work of Israeli designer Amir Glinik, who centered his design around the theoretical application of the Ferrari Enzo's V12 engine, chopped down to four cylinders and modified to drive just one wheel in a motorcycle frame.

Around the V4 engine, Glinik has designed a fluid shape that may appear more futuristic in its styling than inspired by current roadcar designs, but certainly catches your attention. Glinik has even planned out the theoretical controls, which blend elements from an F-16 fighter jet (more common in his home country than Ferraris, anyway) and the Scuderia's high-tech Formula One steering wheel, supplemented by a weatherproof touch-screen LCD atop the fuel tank.
